text (article)

Analítica

Despite the recent growing interest on language disorders in children autism, there is a notorious lack of research work that analyses the correlation of the language variables between them and with other behavioural variables. This article does perform such an analysis by correlating linguistic variables between them (L.M.E, structural complexity, comprehension, echo percentages and social speech, etc.) and with non linguistic variables (global developmental quotient, levels of imitation, perception, motility, ocular/manual integration and cognitive and verbal/cognitive, P.P.O.D). The analysis of intergroups data allows the identification of linguistic index, very interesting to conduct the clinical evaluation; offers the basis of a prognosis evaluation and situates the language alterations within a global context of anomalies that affect the construction of intentional behaviour, the development of symbolic codes and the symbolic and presymbolic relational behaviour
