

Abordaje enfermero ante la duda o rechazo vacunal en la población infantil [

2020

text (article)

Analítica

Context: vaccination prevents diseases through the immunization process, being a public health intervention and a nursing competence. Actually, some parents have misgivings about the vaccination of their children, showing doubts, reticence or rejection of it. Objective: knowing the parentss reasons for vaccine hesitancy or refusal, examining the strategies that allow health care providers to address them, and analyzing the nurses role when caring unvaccinated children. Methods: a narrative review was made using databases of Pubmed, Cinahl, Cuiden, Dialnet, Ibecs, Medes, Lilacs and Cochrane. It was established a time limit from 2014 to 2019 of the publications in English, French or Spanish. Articles that addressed the projects objectives were included. Results: 18 articles were selected which main categories of analysis were: arguments of parents to doubt or refuse vaccination, how to be addressed by the nurses, their dismissal of unvaccinated children, and the individual right and mandatory vaccination. Conclusions: nurses can address parental arguments creating a relationship of trust through communication or educational techniques. In some cases, they may feel dissatisfied in their work and dismiss unvaccinated children, a decision that should not be taken hastily. Mandatory vaccination in some countries is still generating controversies
