

Atención de enfermería ante el neonato intervenido de transposición de grandes arterias [

2021

text (article)

Analítica

Transposition of the great arteries is a congenital cardiac anomaly, in which the position of the pulmonary artery and the aorta is reversed. This paper presents the clinical case of a neonate with this pathology who underwent surgery with the arterial switch technique, which is the most frequently used in these cases, because it is associated with lower mortality and complication rates. Upon arrival of the patient on the hospital ward, she presented a series of medical problems related to her cardiac pathology and surgical intervention, such as diaphragmatic paresis and chylothorax. Also, the needs of feeding, elimination, mobilization, sleep-rest and hygiene were compromised. The parents of the new-born participated in the care provided by nurses. In this sense, counselling on breastfeeding and performing massage as therapy for colic were key to their resolution. Clinical follow-up of these patients is essential to avoid short- and long-term sequelae. Additionally adequate nursing education regarding this type of heart disease is essential in order to meet the needs of this population Transposition of the great arteries is a congenital cardiac anomaly, in which the position of the pulmonary artery and the aorta is reversed.
