

Caracterización de las funciones ejecutivas (planeación, control inhibitorio y flexibilidad mental) y representaciones sociales de suicidio en personas con historia de intento de suicidio [

2010

text (article)

Analítica

This study aims to characterize the executive function: inhibitory control, sequential planning, mental flexibility and social representations of suicide. This was a mixed-method research with a dominant quantitative approach. People who took part in the study were patients admitted to the emergency room at University Hospital Moncaleano Hernando Perdomo for attempted suicide from 1st January 2007 to 30th June 2009. Data was collected through a number of instruments: psychological clinical history, suicide risk scale of Plutchik (1994); Buss and Perry's aggression questionnaire, Spanish version 2002; impulsivity functional / dysfunctional scale of Dickman, Spanish version 2003; Minimult personality inventory; Tower of Hanoi Seville, Stroop Color Test 3rd edition 2001; Wisconsin Card Sorting Test, long version 2nd edition 2001; and Network Association proposed by Annamaria Silvana De Rosa (1996). The findings demonstrated that a suicide attempt is not due to a fault in the control of impulses, but it can be the result of inadequate strategies to solve problems
