

Causas y consecuencias en el consumo de drogas: un estudio de casos en estudiantes de bachillerato [

2016

text (article)

Analítica

Abstract This article aims to provide a review of the main psychosocial factors related to drug use in adolescence. For the implementation of this experience were analyzed case studies developed with students who use drugs at the "Colegio Nacional Portoviejo", as well as interviews with the staff of the Department of student counselling. The results of the comparison showed that there is a significant relationship between systematic consumption of drugs and some risk factors present in the family and the social environment of adolescents. The present study stresses that in relation to an appropriate intervention, there must be a strengthening of the social partners, family, education, any social institutions, involved in the integral formation of young people. Key words: Adolescence, addiction, drugs, family, risk factors
