

Distribución y uso tradicional de *Sagittaria macrophylla* Zucc. y *S. latifolia* Willd. en el Estado de México [

2005

text (article)

Analítica

Sagittaria macrophylla and *S. latifolia* are emergent aquatic plants which grow along the shorelines in clean shallow pools with slow moving water. *Sagittaria macrophylla* is endemic to Mexico. Its distribution is limited to the region of to the Lerma River and the Valley of Mexico. It is nowadays considered to be in danger of extinction. *Sagittaria latifolia* it is distributed from Canada to the Northwest of South America. It can be found in at least 11 states in Mexico. An analysis of the distribution of both species shows a decrease in the State of Mexico; apparently, it is due to the following factors: demographic explosion, loss of habitat, and over-exploitation. There was no record regarding the use of *S. latifolia* in Mexico, nowadays, its tubers or 'water potatoes' are considered to have economic significance for the region of the Lerma River. The traditional usage of both species suggests another alternative for human and animal diet
