

Actividades humanas y Espacios Naturales Protegidos: los humedales del sur de Córdoba [

2016

text (article)

Analítica

The wetlands in Southern Cordoba are the geographical presentation of a meaningful group of lakes (with different sizes and features) that, in the Campiña Alta, constitute a valuable example of endorreism in inner Andalusia. They reunite an ancient integration within the surrounding agricultural areas, from which they have been historically part of, and the preservation of a set of environmental values that, at the end of the 20th century, attracted naturalists to the point of turning these wetlands into the epitome of the urgent need to pass protecting measures to shield that biotic wealth and, later, landscape richness. As a powerful environmentally valuable counterpart of the mighty olive grove agriculture surroundings, the landscape singularities and its biodiversity were the ground for their turning into an outstanding and unique part of the natural Andalusian heritage. All without the loss of the dense settlement and the important and meaningful agrarian landscape, typical from this geographical setting. The goal of our study will be to unravel the circumstances and vicissitudes that took place during this process, paying special attention to the new interrelations created within the wetlands and the society they are part of since their proclamation as Natural Protected Areas
