

Análise da execução orçamentária do Governo Federal Brasileiro em saúde e educação, 2000-2018, sob a ótica da Teoria do Equilíbrio Pontuado [

2022

text (article)

Análítica

This study aims to analyze, from the perspective of the Punctuated Equilibrium Theory (PET), whether the decision making in budgetary executions in the Brazilian Federal Government, in the areas of health and education, were carried out based on stable processes or in moments of sudden (atypical) changes in the period from 2000 to 2018. The analyzes were performed with updated data for November 30, 2019, using the Kolmogorov-Smirnov and Shapiro-Wilk tests to test the normality of resource allocations. The results showed that the decisions were made based on stable processes. The percentage changes in the use of resources occurred on an incremental basis (normal distribution). It is observed that this research contributes to the literature that deals with the analysis of the allocation of public resources when using the theoretical model. They highlight the findings that it is necessary to rethink the allocations of budgetary resources in the areas of health and education in Brazil; that incremental decision-making needs to be reviewed and that judicialization in the area of public health needs an in-depth discussion of the Legislative and Executive Powers
