

Análisis de datos censurados para ingeniería y ciencias biológicas [

2007

text (article)

Analítica

The statistical analysis of lifetime or response time data has become a topic of considerable interest to mathematicians and statisticians in areas such as engineering, medicine, and the environmental sciences. Maximum likelihood methods have been one of most important tools to solve problems from analysis of lifetime to reliability analysis data. Taking typical problems of several areas and using these methods, it intends motivate to scientists, engineers, and students in censored data analysis. An example is presented about a clinical trial, which was conducted to determine whether a hormone treatment benefits women who suffer breast cancer [3]. On the other hand, an example of the degradation analysis is presented to estimate parameters model fatigue crack-size for an alloy [5]. Finally, it emphasizes on a test procedure for comparing medians in a lognormal two-sample context containing two pollutants [12]. Comparisons are made between the lognormal methodology introduced here and the non-parametric methods used by Millard [6]. SPLIDA [10] and SPLUS [11] are used to implement the methodologies
