

Análisis del riesgo biológico del personal asistencial y operativo caso centro de salud costa norte colombiana [

2021

text (article)

Analítica

Objective: Carry out an analysis of the critical tasks associated with biological risk of the assistance and operational personnel of a health center on the Colombian north coast. **Methodology:** The study was of a descriptive type which allowed to identify, analyze, interpret, the dangers associated with the health activity of a clinic on the north coast of Barranquilla, in order to propose preventive measures or strategies that would minimize the possibility or consequences of work accidents and biological occupational diseases. **Results:** In the analysis of the tasks carried out with the clinic workers, it was evident that those with the greatest exposure to losses, in terms of biological risk, are those in which the worker has direct interaction with the patient and performs procedures in which he enters into contact with contaminated material, mucous membranes, body fluids, etc., from contaminated patients. **Conclusion:** The study confirmed that nursing assistants, general practitioners and specialists, as part of the healthcare personnel, occupy the highest positions in terms of exposure to biological risk due to the type of tasks they perform daily within their work
