

La pandemia de gripe de 1918-1919 en territorio asturiano: de padecimiento histórico a enfermedad emergente cien años después [

2019

text (article)

Analítica

The 1918/19 influenza pandemic has been considered one of the biggest health disasters of the twentieth century. In Spain it reached a mortality rate of 13.03 per thousand inhabitants. This study shows a distinct reality in the Principality of Asturias, on the one hand we have Oviedo, Gijón and Avilés as centers of urban structure with a mortality rate of 8.80 per thousand inhabitants. On the other hand, Cangas del Narcea, representing a rural area, where the disease lasted longer and caused a significantly higher mortality. Flu is a disease that is still active today
