

# Análisis del vehículo de planeo hipersónico DF-ZF: una mirada al sistema de innovación de defensa de China [

2023

[text \(article\)](#)

Analítica

On 27July, 2021, China conducted a test with the DF-ZF hypersonic glide vehicle (HGV), which orbited the Earth before reaching its target and prompting certain US authorities to describe the situation as "worrying" (Sevastopulo, 2021). China's hypersonic weapons programme has attracted a great deal of global attention and research interest in recent years. China's development of a hypersonic weapon system is relevant because of what it provides for the People's Liberation Army (PLA), but even more so because of what it could mean for China's ability to innovate in the field of defense technology. This article examines the technological project that gave rise to the DF-ZF HGV, and using T. M. Cheung's (2021: 775-801) model of defense innovation systems, analyses the main factors of the Chinese system to find its potential strengths and weaknesses
