

How to push Django Python apps to Heroku for web hosting /

Elder, John,
on-screen presenter

Instructional films

Material Projectable

Learn: Install Python. Install Django. Install Virtualenv. Install Git Bash. Install the Heroku Toolbelt. Install Heroku dependencies. Push Django code to Heroku. Create basic database apps in Django. About: Do you know how to build Django apps with Python, but aren't sure how to get your app onto the internet? This course is for you! In this course we teach you how to host your Django Python apps on Heroku. We'll build a cool address book app in Django 2 and Python 3. The main goal of this course, though, is to teach you how to get your Django apps off your computer and hosted live online. You'll learn how to Install Python, Django, Virtualenv, Git Bash for Windows and Heroku Toolbelt. Tweak a Django app's setting so it works with Heroku. Push your code to GitHub and Heroku. Set up Postgres databases in the cloud. Build a cool little address book app. And much more ... You'll be walking through this course on a Windows computer, but if you're using a Mac or Linux, you should be fine too. I try to point out any differences along the way. If you've ever been confused by pushing code to a professional web hosting provider in Django, then this is the course for you
