Monografía

This book focuses on the cost planning of building construction projects with special reference to the Australian and New Zealand context. Design development and cost planning with elemental analysis are emphasised in the pre-construction cost management process in the region. This book translates the well-established practice of pre-construction cost management process in the construction industry into a published academic and professional resource which can be used for teaching higher education students and for professional training programs. Building cost planning is considered from the client and the design team's perspective and focuses on the functions of a cost manager. From the overview of the construction industry and the client's team, to the detailed cost planning process and cost planning techniques at progressive stages in the pre-construction phase, this book is ideal as a guide to cost plan building construction projects. It follows an interactive style by featuring learning outcomes, self-review questions and learning activities for each chapter. It also extends theory into applications with case studies incorporated from the Australian and New Zealand construction industries. These approaches make this book useful for both students and practitioners in construction management
