Analítica

Introduction: Autism spectrum disorders (ASD) are neuropsychiatric problems whose first manifestations appear before three years of age and persist throughout life. Objective: To recognize the nursing approach in the care of children with autism spectrum disorder, from the theory of humanized care and the theory: interaction for the evaluation of child health. Materials and method: This study is a systematic review, through the search equation in DeCS with the keywords: Autism, nursing, humanized care, in different databases. Results: Through Watson's theory, the nursing approach documented through the concepts: nurse/patient interaction, phenomenological field, transpersonal care relationship, moment of care, humanization can be fulfilled in the care of autistic children and their families. Also from Barnard's theory with the integration of theoretical elements: clarity of the child's messages, child's response to the caregiver, parental sensitivity to the child's signals, allowing work on the child's health of the child with ASD. Conclusion: Behavioral approaches produce positive results in children with ASD
