

Control and Monitoring of Chemical Batch Reactors [

Caccavale, Fabrizio

Springer London :
Imprint: Springer,
2011

Monografía

Methodological and technological problems related to batch chemical reactors are often very challenging and require contributions from experts in several disciplines (chemistry, chemical engineering, materials science, control engineering, measurement and sensing). A number of problems have to be tackled when dealing with batch reactors in industrial applications, ranging from design and planning of the plant to scheduling, optimization and performance achievement of batch operations. In order to meet such requirements, some fundamental issues need to be faced: modeling of the reactor and of the process, identification of the parameters in the mathematical models, control of the variables characterizing the process and early diagnosis of failures. Control and Monitoring of Chemical Batch Reactors is aimed at tackling the above problems from a blending of academic and industrial perspectives. Advanced solutions (i.e., those based on recent research results) to the fundamental problems of modeling, identification, control and fault diagnosis for batch processes are developed in detail in distinct chapters. In each chapter, a general overview of foundational concepts is also given, together with a review of recent and classical literature on the various subjects. To provide a unitary treatment of the different topics and give a firm link to the underlying practical applications, a single case study is developed through the course of the book. Namely, a batch process of industrial interest, i.e., the phenol-formaldehyde reaction, is adopted to test the proposed techniques. In this way, a roadmap for the development of control and diagnosis systems is provided, ranging from the early stages of the production process to the complete design of control and diagnosis systems. Hence, the book is directed to both industrial practitioners and academic researchers, although it is also suitable for adoption in advanced post-graduate level courses focused on process control, control applications and nonlinear control. Advances in Industrial Control aims to report and encourage the transfer of technology in control engineering. The rapid development of control technology has an impact on all areas of the control discipline. The series offers an opportunity for researchers to present an extended exposition of new work in all aspects of industrial control

Título: Control and Monitoring of Chemical Batch Reactors Recurso electrónico-En línea] by Fabrizio Caccavale, Mario Iamarino, Francesco Pierri, Vincenzo Tufano

Editorial: London Springer London Imprint: Springer 2011

Descripción física: XVII, 186p. 62 illus. in color. digital

Tipo Audiovisual: Engineering Chemical engineering Engineering Control Industrial Chemistry/Chemical Engineering

Mención de serie: Advances in Industrial Control 1430-9491

Documento fuente: Springer eBooks

Nota general: Engineering (Springer-11647)

Contenido: Introduction -- Modeling of Chemical Batch Reactors -- Identification of Kinetic Parameters -- Model-based Control -- Fault Diagnosis -- Conclusions and New Directions

Restricciones de acceso: Accesible sólo para usuarios de la UPV

Tipo recurso electrónico: Recurso a texto completo

Detalles del sistema: Forma de acceso: Web

ISBN: 9780857291950

Autores: Iamarino, Mario Pierri, Francesco Tufano, Vincenzo

Entidades: SpringerLink (Servicio en línea)

Enlace a formato físico adicional: Printed edition 9780857291943

Punto acceso adicional serie-Título: Advances in Industrial Control 1430-9491
